

Reality FX — Investor & Partnership Presentation

WHY REALITY FX IS WORTH YOUR ATTENTION

“Every lesson is a trade. Every trade is a lesson.”

REALITY FX — INVESTOR & PARTNERSHIP PRESENTATION

Why Reality FX is worth your attention

Prepared by the Reality FX founding team · RFX-themed · For investors, sponsors, strategic partners and brand stakeholders

The one-line thesis: *The world tells young people "learn to trade" and then hands them a real-money account. We built the institution that teaches them to trade — safely, measurably, and at scale — before they ever risk a cent.*

01 • EXECUTIVE OVERVIEW

What Reality FX is

Reality FX is a digital trading education institution — not a course website. It is a connected ecosystem that takes a complete beginner from *first discovery* through *registration and identity verification*, through *structured education across 13 chapters in three difficulty lanes*, through *practice inside a simulated trading environment with live market prices*, through *institutional trading challenges that reward genuine skill*, and finally toward *real trading with discipline, risk management and evidence*.

The problem we are addressing

Traditional trading education is broken in four measurable ways:

1. **It's theory-heavy and practice-free.** Students watch videos and then are expected to trade real money.

2. **It's unstructured.** Random Telegram signals and scattered YouTube content create no curriculum, no progression, no assessment.
3. **It's unverifiable.** Anyone can claim to be a trader. There is no system that measures whether a student actually learned anything.
4. **It's risky by design.** The industry funnels beginners straight to live accounts, where the market — not the student — decides the outcome.

Our solution

A complete institutional pipeline: **Learn** → **Practice** → **Replay** → **Trade** → **Measure** → **Improve**.

The student advances through the OS only when the system confirms they have mastered the material. They practice in a controlled simulation where losing is a lesson and not a loss. They prove themselves in machine-graded challenges. Only then are they equipped — mentally and technically — for real markets.

Our differentiation

Dimension	Typical trading course	Reality FX
Curriculum	Video library	13 chapters × 3 difficulty lanes (Standard → Challenging → Elite), Forge-verified
Assessment	Certificate of completion	Machine-graded assessments, accuracy tracking, 80% progression gate
Practice	"Trade on your own"	Built-in simulated arena with live prices, orders, positions, drawdown
Proof	Testimonials	Machine-measured performance, challenge results, Hall of Fame records
Safety	None	Identity verification, guardian consent for minors, PII scanning, no real money until ready
Structure	One-size-fits-all	Personalised pace, trust bar, recognition of fast, honest learners

Long-term vision

To become the default *first institution* for young people entering financial markets — in Southern Africa first, then across the continent, then internationally. We are building an educational brand that produces *evidence*: verified students with measured ability, not just certificates.

02 · MARKET OPPORTUNITY

The macro forces

- **Financial literacy is a global gap.** Most people never learn how markets, money and risk actually work — in school or anywhere else.

- **Young people are entering markets earlier than ever.** Mobile-first trading apps have made "trading" a mainstream ambition for 18–35 year olds.
- **The education layer is missing.** The apps provide access; almost nobody provides *competence* before access.
- **Africa's demographic dividend.** A young, growing, mobile-connected population with rising disposable income and almost no structured trading education at scale.

The segments

1. **Retail trading education** — the direct, global market we serve.
2. **Digital / online learning** — the broader e-learning wave we ride.
3. **Financial literacy for young people** — the under-served, high-trust segment (including schools and parents).
4. **University partnerships** — structured programs, guest lectures, campus activations.
5. **Challenge / esports-style competitions** — a natural fit for sponsorship and brand activation.

Why now

The infrastructure that makes this possible — real-time market data APIs, embeddable charting, low-cost hosting with serverless functions, and email delivery — has only recently become cheap enough for a lean institution to build a complete product. We have. And the OS is already feature-complete: the heavy architecture is built, so growth is now a distribution and content question, not a product-build question.

03 • BUSINESS MODEL

How Reality FX generates revenue

Current streams:

- **Course packages** — the core product: the full 13-chapter, three-lane curriculum with mentor support tiers.
- **Mentor tier** — one-on-one lesson access for students who want direct guidance (priority for new students).
- **Coupon / demo-pass system** — a structured acquisition mechanic: coupons route prospects to registration and can carry discounts (e.g. 5%), once-only, non-renewable.

Future streams (architected, not built):

- **Challenge ecosystems** — sponsored trading challenges where brands fund prize pools in exchange for activation and data.
- **Brand partnerships** — in-OS sponsor placements (studio, break room, arena) for finance, tech and education brands.
- **Institution licensing** — universities and schools licensing the OS as their financial-literacy infrastructure.

- **Prop-style assessment** — the challenge engine is, at its core, a machine that certifies trading skill; that certification has standalone value.
- **Premium certifications** — verified performance records and challenge credentials for CVs and recruitment.

Unit economics in plain terms

- **Revenue per student** = package price + upsells (mentor, challenges, certification).
- **Margins are structurally high** — the product is digital, delivery is automated, and the OS does the teaching, assessing, auditing and reporting. Staff handle exceptions, not volume.
- **Customer acquisition** is coupon-driven, referral-driven and campus-driven — we are not buying expensive ads to survive.

Honest unknowns (to be supplied by the founder)

- Current revenue figures (first paid cohort).
- Operating costs to date.
- Precise conversion rates from visitor → registrant → paid student.
- Student acquisition cost per channel.

These numbers are deliberately not invented. This document is written to force the economics to be measured — which is itself a professional signal.

o4 • FINANCIAL PROJECTIONS (SCENARIO FRAMEWORK)

Methodology note: These are framework scenarios, not promises. Each row is a model input the founder can fill from real data. We model three scenarios so an investor can see the sensitivity — not a single invented number.

Scenario A — Conservative (organic, coupon-led, one market)

- ~150 students in year 1, ~600 in year 3.
- Single package price, low churn, no paid ads.
- Roughly break-even on costs by year 2–3.

Scenario B — Growth (campus + partnerships, two markets)

- ~600 students in year 1, ~5,000 in year 3.
- University partnerships add credibility and volume.
- Challenge sponsorships begin offsetting student-acquisition costs.

Scenario C — Institutional (sponsorships + licensing)

- 10,000+ students by year 3–5, plus licensed deployments.
- Multiple revenue streams; margins widen as the OS absorbs volume with near-zero marginal cost.

The capital question

Reality FX is asking for the capital to do four things:

1. **Distribution** — campus tours, partnerships, the university presentation (Document 3), sponsor outreach.
2. **Scale infrastructure** — more serverless capacity, live-market data tier, email volume, and the performance budget for 10,000 simultaneous students.
3. **Compliance** — legal structure, data protection, safeguarding policies, and the governance work in §06.
4. **Content** — the Forge never stops: deeper chapters, more challenge formats, and mentor scaling.

Break-even and return considerations

- Because delivery is automated, break-even is a *student-count* question, not a *time* question: the OS serves 10 students at nearly the same cost as 10,000.
- The principal return scenario for an early investor is institutional growth + sponsorship/licensing revenue, not tuition alone.

05 · TECHNOLOGY & COMPETITIVE ADVANTAGE

What we actually built

Reality FX is **not a collection of webpages**. It is two communicating systems:

System A — Verification & Registration (the security hub). The public front door: reception, registration, identity verification, device/location fingerprinting ("Is this really you?"), guardian consent for minors, coupon redemption, and the staff consoles (registrar, audit, security, coupon analytics). It issues every student their official RFX identity.

System B — The RFX OS (the campus). The learning and trading environment: dashboard, journey map, 13 chapters × 3 lanes, assessments, performance, fair play, certification, academy vault, laboratory, AI mentor, live rooms, the trading arena, break room, study hall, trade journal, and the Hall of Fame.

The communication rails

- **The handshake rail** — System A issues an identity; the OS consumes it. A student cannot enter the OS without a verified identity from System A.
- **The audit rail** — a machine audit (`audit-regression.pl`, one command, ~30 seconds) runs 12+ sections of regression checks before every deploy: file integrity, page stamps, function contracts, handoff fields, coupon rail, journal standards. **The inspection is a machine, not a hope.**
- **The email rail** — live emails via Resend (onboarding, verification codes, guardian confirmation, mentor confirmations) with a `demo-code` fallback so development never blocks

- **The PII rail** — a privacy/DLP scanner that detects sensitive information in chats and alerts students before they send it; incidents land on a staff board.

The trading environment (our moat)

- A **simulated trading arena** with live market prices and a real TradingView chart, where students place orders, manage positions, and watch P/L in both percentage and monetary terms.
- **Machine-graded challenges** — profitability, risk management, max drawdown, risk per trade, consistency, rule adherence. The machine distinguishes "made 30% recklessly" from "made 10% with discipline."
- **Performance evidence** — every student produces a measurable track record inside the institution.

The Forge Standard

Every chapter is built to a verified standard — **Teach** → **Demonstrate** → **Challenge** → **Assess** → **Explain** → **Verify** — and structurally checked before it ships. Content is the product, and the product is quality-controlled.

Scalability

- Static-first hosting with serverless functions; the OS serves from a global CDN.
- State is device-local by design for student records; identity and verification live in System A.
- 600 simultaneous simulated positions was our stress test — it revealed a known performance ceiling, which is now a documented optimization target rather than a hidden surprise.

o6 · GOVERNANCE, COMPLIANCE & RESPONSIBILITY

Our honest operating position

Reality FX is an **educational institution**, not a regulated financial services firm. We do not hold client money, we do not execute real trades for students, and we do not claim regulatory approval we do not have.

What that means, professionally stated

- **We teach.** Students practice in a simulation; no student ever risks real money inside the OS.
- **We disclose.** Our materials carry honest risk warnings and distinguish education from regulated financial services.
- **We are building the governance layer.** Legal structure, data protection, safeguarding for minors, consumer protection, financial reporting, and responsible-growth practices are on the roadmap and funded by this raise.

The compliance agenda (as we scale)

1. Legal entity structuring and contracts (including staff contracts and trial contracts).

2. Data protection aligned to GDPR-style principles — encryption in transit and at rest, access logging, role-based access control, data minimization, masking.
3. Safeguarding policy for students under 18 — parental/guardian authorization before enrollment, restricted communication, and consent records.
4. Financial reporting and, where relevant, the licenses that an education-and-assessment model requires in each market.
5. Regular security audits and penetration testing as the student base grows from hundreds to thousands.

Why this matters to an investor

A trading-education company that *ignores* regulation is a liability. One that treats governance as a designed system — with the same discipline as its product — is an institution in the making. We are building the latter.

07 · PARTNERSHIP & SPONSORSHIP OPPORTUNITIES

What a partner receives by working with Reality FX

- **Brand activation inside a serious product.** The studio, break room, arena and Hall of Fame are real environments students use daily — not banner ad space.
- **Challenge sponsorship.** Fund a challenge prize pool (e.g. the R3,000 trading boost model) and your brand is associated with *measured skill development*, not gambling.
- **University activations.** Campus tours, guest lectures and workshops reach the exact demographic your brand wants.
- **Co-branded certifications.** A student's verified performance record can carry both brands.
- **Data (with consent).** Aggregate, anonymized performance trends show real engagement — a sponsor can see that students actually use the environment.

Possible partnership models

Model	What the partner gives	What the partner gets
Challenge sponsor	Prize pool	Brand placement + winner association
Platform partner	Market data / charting / infrastructure	Distribution + product showcase
University partner	Venues, students, credibility	Financial-literacy infrastructure
Brand partner	Funding / product	In-OS activation + co-branded content
Mentor network	Expertise	Verified student pipeline

08 · GROWTH STRATEGY

1 year — Prove the machine

- First paid cohorts complete the full pipeline (register → verify → learn → practice → challenge).
- First verified success stories and Hall of Fame entries.
- University pilot program in the home market.
- Governance and compliance foundation (structure, policies, data protection).

3 years — Expand the footprint

- Multiple markets; campus programs in several universities.
- Sponsored challenge calendar with real prize pools.
- 5,000+ active students; the OS serving them at near-zero marginal cost.
- First licensing conversations (schools, academies).

5 years — Become the institution

- 10,000+ students; international expansion.
- Licensing and certification products standing on their own.
- A recognized brand for financial education in Africa and beyond.
- The proof is in the machine: a documented history of students who learned, practiced, proved themselves, and traded with discipline.

09 • THE ASK

We are not asking for investment in a course. We are asking for partnership in an institution.

What we need:

- **Capital** to fund distribution, infrastructure scale, compliance and content depth.
- **Partners** who bring distribution (universities, brands, platforms) or infrastructure (market data, charting, email).
- **Belief** in the core thesis: *young people can be taught to trade safely, and the institution that proves it wins the market.*

What you receive:

- Equity or partnership terms (founder-led discussion).
- A product that is already feature-complete and audit-verified.
- An honest, governed, measurement-driven operating model.
- A seat at the table while the institution is still young enough for your involvement to shape it.

10 • CLOSING

Reality FX has reached the **full-max stage of the OS**: the architecture is built. the content is Forge-

Measure → **Improve** — is complete.

The next chapter is not product. It is **scale**: more students, more partners, more proof.

Every lesson is a trade. Every trade is a lesson.

Let's build the institution together.
